

## Question Workflow

- Bounded context: “Question context”
  - Workflow: “New question”
    - Triggered by: “New question request received”
    - Input: “New question form” (Title, body, tags)
    - Other inputs: Validation of text via ML
    - Output: “New question added” event
    - Side effects: Question is posted and user is notified

### Workflows documentation

- Workflow: “New question”
  - Input: “New question form”
  - Output: “New question added” event

//step1

Fill question form

//step2

Check form data for invalid entries

If form is invalid then

Stop

//step3

Send confirmation notification

//step4

Return “New question added” event

- Substep “Validate new question form”
  - Input: “Unvalidated new question form”
  - Output: “Validated new question form”
  - Dependencies: Confirmation message
- Validate question title
- Validate question body
- If all validation passed then:
  - Return validated new question form
- Else return Validation error
